1.0 INTRODUCTION

This report presents the results of a traffic study carried out to evaluate the Henry Mayo Newhall Memorial Hospital (HMNMH) Master Plan project located in the City of Santa Clarita. It provides the traffic and circulation material for the Environmental Impact Report (EIR) prepared for this project.

1.1 PROJECT DESCRIPTION

A detailed description of this project and the resulting California Environmental Quality Act (CEQA) requirements addressed here can be found in the Notice of Preparation and in the EIR itself. The Henry Mayo Newhall Memorial Hospital and G&L Realty have proposed a Master Plan to guide future development of the inpatient (hospital), outpatient medical office buildings and administrative medical facilities at the existing HMNMH medical campus.

Currently, the project site is developed with the existing HMNMH medical campus. The project proposes to increase the existing square footage of the hospital campus (30.39 acres) from 332,992 square feet to 660,355 square feet, a 327,363 square-foot increase. The 327,363 square-foot total for the proposed HMNMH Master Plan buildings is comprised of the following:

Inpatient Building A (IBA)	125,363 square feet
Medical Office Building 1 (MOB 1)	80,000 square feet
Medical Office Building 2 (MOB 2)	60,000 square feet
Medical Office Building 3 (MOB 3)	60,000 square feet
Central Plant	10,000 square feet
Foundation Building (to be demolished)	(8,000 square feet)

As shown above, the net build out of the medical campus totals results in 127,363 square feet of new hospital area and 200,000 square feet of new medical office area.

The project site is generally located north of the intersection of Orchard Village Drive and McBean Parkway, and is one mile east of the Interstate 5 (I-5) freeway in the City of Santa Clarita. The project area is within the existing HMNMH medical campus located at 23845 McBean Parkway and is generally surrounded by residential uses. Figure 1-1 illustrates the location of the site in relation to the surrounding roadway system.

1.2 STUDY AREA

The study area includes the roadways and intersections near to the project site and those locations where project-generated traffic could cause a significant impact. Figure 1-2 illustrates the intersections selected for study through consultations with the City's Transportation and Engineering Services staff. The selection criteria is generally based on the project generating 50 or more new peak hour trips in the peak direction at an intersection. Several intersections with fewer than 50 project peak hour/peak direction trips have also been included as determined on a case-by-case basis.

1.3 METHODOLOGY

The traffic analysis evaluates the proposed project for an Interim Year horizon (approximately 10 to 15 years in the future), and for a long-range cumulative (approximately year 2030) buildout time frame. The distribution of project traffic and the future year forecasts are derived using the Santa Clarita Valley Consolidated Traffic Model (SCVCTM). The SCVCTM was developed jointly by the City of Santa Clarita and the County of Los Angeles and is the primary tool used for forecasting traffic volumes for the Santa Clarita Valley.

The impact analysis is based on specific performance criteria which are outlined in the following section. Where appropriate, mitigation measures are identified for those scenarios in which significant impacts are determined based on the established impact thresholds.

STUDY AREA INTERSECTIONS

1.4 PERFORMANCE CRITERIA

For CEQA purposes, defined performance criteria are utilized to determine if a proposed project causes a significant impact. In most traffic studies, performance criteria are based on two primary measures. The first is “capacity”, which establishes the vehicle carrying ability of a roadway and the second is “volume.” The volume measure is either a traffic count (in the case of existing volumes) or a forecast for a future point in time. The ratio between the volume and the capacity gives a volume/capacity (V/C) ratio and based on that V/C ratio, a corresponding level of service (LOS) is defined. Traffic LOS is designated A through F with LOS A representing free flow conditions and LOS F representing severe traffic congestion. Traffic flow quality for each LOS is described in Table 1-1.

Both the V/C ratio and the LOS are used in determining impact significance. Certain LOS values are deemed unacceptable by the City and increases in the V/C ratio which cause or contribute to the LOS being unacceptable are defined as a significant impact (see following sections for details).

1.4.1 Arterial Roads

For the arterial system, a number of techniques are available to establish suitable V/C ratios and define the corresponding LOS. These definitions and procedures are established by individual local jurisdictions or by regional programs such as the Congestion Management Program (CMP).

The analysis of the arterial road system is based on peak hour intersection performance and on total average daily traffic (ADT). For intersections, the intersection capacity utilization (ICU) methodology is applied, providing a planning level basis for determining V/C and LOS. This methodology sums the V/C ratios for the critical movements of an intersection and is the preferred procedure for intersection analysis by the City of Santa Clarita. The ICU methodology is generally compatible with the intersection capacity analysis methodology outlined in the *HCM 2000*. For roadway ADT, LOS is determined using capacities identified in the City’s Circulation Element and traffic volumes from the SCVCTM.

Table 1-1
LEVEL OF SERVICE DESCRIPTIONS

LOS	Arterial Roads	Freeway Segments
A	Describes primarily free-flow operations at average travel speeds, usually about 90 percent of the free-flow speed for the given street class. Vehicles are completely unimpeded in their ability to maneuver within the traffic stream. Control delay at signalized intersections is minimal.	Describes free-flow operations. Free-flow speeds prevail. Vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream. The effects of incidents or point breakdowns are easily absorbed at this level.
B	Describes reasonably unimpeded operations at average travel speeds, usually about 70 percent of the free-flow speed for the street class. The ability to maneuver within the traffic stream is only slightly restricted, and control delays at signalized intersections are not significant.	Represents reasonably free flow, and free-flow speeds are maintained. The ability to maneuver within the traffic stream is only slightly restricted, and the general level of physical and psychological comfort provided to drivers is still high. The effects of minor incidents and point breakdowns are still easily absorbed.
C	Describes stable operations; however, ability to maneuver and change lanes in midblock locations may be more restricted than at LOS B, and longer queues, adverse signal coordination, or both may contribute to lower average travel speeds of about 50 percent of the free-flow speed for the street class.	Provides for flow with speeds at or near the free-flow speed of the freeway. Freedom to maneuver within the traffic stream is noticeably restricted, and lane changes require more care and vigilance on the part of the driver. Minor incidents may still be absorbed, but the local deterioration in service will be substantial. Queues may be expected to form behind any significant blockage.
D	Borders on a range in which small increases in flow may cause substantial increases in delay and decreases in travel speed. LOS D may be due to adverse signal progression, inappropriate signal timing, high volumes, or a combination of these factors. Average travel speeds are about 40 percent of free-flow speed.	The level at which speeds begin to decline slightly with increasing flows and density begins to increase somewhat more quickly. Freedom to maneuver within the traffic stream is more noticeably limited, and the driver experiences reduced physical and psychological comfort levels. Even minor incidents can be expected to create queuing, because the traffic stream has little space to absorb disruptions.
(cont.)		

Table 1-1 (cont.)

LEVEL OF SERVICE DESCRIPTIONS

LOS	Arterial Roads	Freeway Segments
E	Characterized by significant delays and average travel speeds of 33 percent or less of the free-flow speed. Such operations are caused by a combination of adverse signal progression, high signal density, high volumes, extensive delays at critical intersections, and inappropriate signal timing.	At its highest density value, LOS E describes operation at capacity. Operations at this level are volatile, because there are virtually no usable gaps in the traffic stream. Vehicles are closely spaced, leaving little room to maneuver within the traffic stream at speeds that still exceed 49 miles per hour. Any disruption of the traffic stream, such as vehicles entering from a ramp or a vehicle changing lanes, can establish a disruption wave that propagates throughout the upstream traffic flow. At capacity, the traffic stream has no ability to dissipate even the most minor disruption, and any incident can be expected to produce a serious breakdown with extensive queuing. Maneuverability within the traffic stream is extremely limited, and the level of physical and psychological comfort afforded the driver is poor.
F	Characterized by urban street flow at extremely low speeds, typically one-third to one-fourth of the free-flow speed. Intersection congestion is likely at critical signalized locations, with high delays, high volumes, and extensive queuing.	Describes breakdowns in vehicular flow. Such conditions generally exist within queues forming behind breakdown points. LOS F operations within a queue are the result of a breakdown or bottleneck at a downstream point. LOS F is also used to describe conditions at the point of the breakdown or bottleneck and the queue discharge flow that occurs at speeds lower than the lowest speed for LOS E, as well as the operations within the queue that forms upstream. Whenever LOS F conditions exist, they have the potential to extend upstream for significant distances.

Source: *Highway Capacity Manual 2000 (HCM 2000)*, Transportation Research Board, National Research Council.

The ICU calculation methodology and associated impact criteria for the study area arterial system are summarized in Table 1-2. For locations where arterial roadways intersect with freeway on- and off-ramps, the same ICU methodology is utilized. The performance criteria utilized for the evaluation of roadway segments for long-range cumulative (2030) buildout conditions is provided in Table 1-3.

1.4.2 Freeway Segments

For the freeway system, the peak hour is the accepted time period used for impact evaluation. The procedures for determining LOS are established by the State of California Department of Transportation (Caltrans) and by regional programs such as the CMP.

The Caltrans guidelines for the preparation of traffic impact studies (see Reference 4 in Section 1.6) define the transition between LOS C and LOS D as the target LOS to be maintained. Caltrans acknowledges that this may not always be feasible and allows for an alternative target LOS when appropriate. If an existing freeway is operating at less (worse) than the appropriate target LOS, the guidelines state that the existing measure of effectiveness (MOE) should be maintained.

The CMP guidelines for a transportation impact analysis (see Reference 8 in Section 1.6) require a simplified analysis of freeway impacts that consists of a demand-to-capacity calculation for the affected CMP monitoring locations. The CMP defines a significant impact occurring when the proposed project increases traffic demand by two percent of capacity ($V/C \geq .02$), causing or worsening LOS F.

Table 1-2

ARTERIAL INTERSECTION PERFORMANCE CRITERIA

V/C Calculation Methodology

Level of service to be based on peak hour intersection capacity utilization (ICU) values calculated using the following assumptions:

Saturation Flow Rates: 1,750 vehicles/hour/lane for all lanes

Clearance Interval: .10

(source: City of Santa Clarita Preliminary Traffic Impact Report Guidelines)

Performance Standard

LOS D or existing LOS, whichever is greater.

(source: City of Santa Clarita General Plan Circulation Element, Policy 1.8)

Impact Thresholds

An intersection is considered to be significantly impacted if:

1. The intersection is forecast to operate deficiently (i.e., worse than the performance standard), and
2. Compared to the ICU in the no-project alternative, the ICU in the with-project alternative increases the ICU by the following:

With-Project ICU	Project Increment
.81 - 90 (LOS D)	greater than or equal to .02
.91 or more (LOS E & F)	greater than or equal to .01

(source: City of Santa Clarita General Plan Circulation Element, Policy 1.8)

Abbreviations:

V/C – Volume/Capacity Ratio

LOS – Level of Service

ICU – Intersection Capacity Utilization

Table 1-3

ARTERIAL ROADWAY PERFORMANCE CRITERIA

V/C Calculation Methodology

Level of service to be based on mid-block V/C ratios calculated using the following capacity assumptions:

<u>LOS</u>	8-Lane Divided	6-Lane Divided	4-Lane Divided	4-Lane Undivided	2-Lane Undivided
A	48,000	36,000	24,000 (28,000)	16,000	5,000
B	54,000	40,400	27,000 (32,000)	18,000	7,500
C	60,000	45,000	30,000 (36,000)	20,000	10,000
D	66,000	49,500	33,000 (40,000)	22,000	12,500
E	72,000	54,000	36,000 (44,000)	24,000	15,000
F	This condition represents system breakdown and does not have a specific relationship to service volumes.				

Source: City of Santa Clarita Circulation Element

Notes: (XX,XXX) = Capacity with limited access on a 4-Lane Divided arterial.

Values shown for LOS E represent the maximum roadway capacity.

Performance Standard

LOS D

LOS – Level of Service

1.5 DEFINITIONS

Certain terms used throughout this report are defined below to clarify their intended meaning:

ADT	Average Daily Traffic. Generally used to measure the total two-directional traffic volumes passing a given point on a roadway.
CMP	Congestion Management Program. A state mandated program administered by the Los Angeles County Metropolitan Transportation Authority (MTA) that provides a mechanism for coordinating land use and development decisions.
ICU	Intersection Capacity Utilization. A measure of the volume to capacity ratio for an intersection. Typically used to determine the peak hour level of service for a given set of intersection volumes.
LOS	Level of Service. A scale used to evaluate circulation system performance based on intersection ICU values or volume/capacity ratios of arterial segments.
Peak Hour	This refers to the hour during the AM peak period (typically 7 AM - 9 AM) or the PM peak period (typically 3 PM - 6 PM) in which the greatest number of vehicle trips are generated by a given land use or are traveling on a given roadway.
Tripend	A trip generation measure which represents the total trips entering and leaving a location.
V/C	Volume to Capacity Ratio. This is typically used to describe the percentage of capacity utilized by existing or projected traffic on a segment of an arterial or intersection.
VPH	Vehicles Per Hour. Used for roadway volumes (counts or forecasts) and trip generation estimates. Measures the number of vehicles in a one-hour period, typically the AM or PM peak hour.

2.0 TRANSPORTATION SETTING

This chapter describes the transportation setting for the traffic analysis. Existing conditions are first discussed, public transportation is addressed and then a description is given of the future circulation systems used in this analysis.

2.1 EXISTING CONDITIONS

The following section describes existing traffic conditions in the study area. It includes a description of the study area roadway system, existing traffic volumes and corresponding levels of service as defined by the performance criteria outlined in the previous chapter.

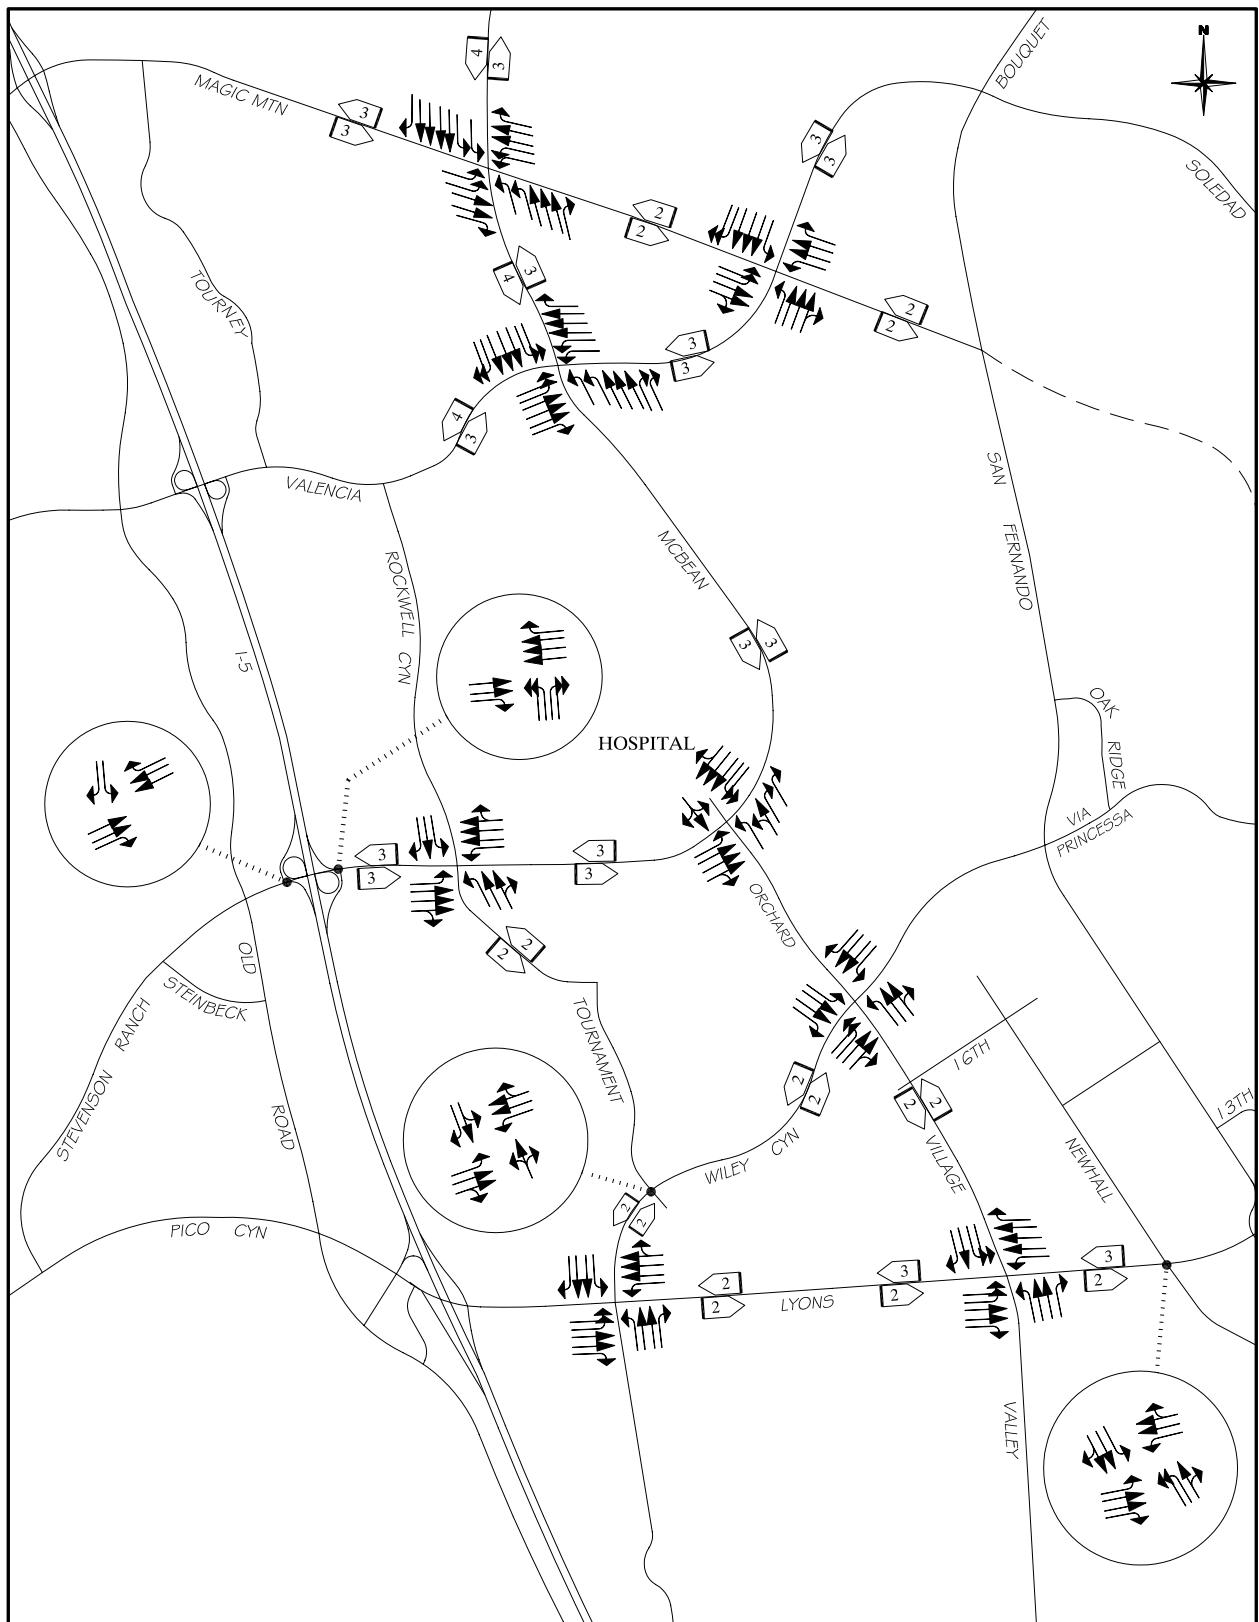

2.1.1 Existing Roadway System

The existing roadway network in the study area is illustrated in Figure 2-1 in the form of mid-block lanes and intersection lane configurations for the intersections being studied. Major arterial streets near the project site consist of McBean Parkway, Orchard Village Road and Rockwell Canyon Road/Tournament Road.

Interstate 5 (I-5) provides regional access for vehicles traveling to and from the project site. The I-5 Freeway is located west the project site and can be accessed from the project site via a full interchange at McBean Parkway.

2.1.2 Existing Traffic Volumes and Levels of Service

The existing conditions average daily traffic (ADT) volumes on the study area roadway system are illustrated in Figure 2-2. Illustrations of existing peak hour turning movement volumes for each study area intersection can be found in Figures 2-3 and 2-4 for the AM and PM peak hours, respectively. The counts were collected between May 2003 and January 2005 for the purpose of this study. For a comparison of these counts to conditions in 2007, see Appendix C.

Figure 2-2

AVERAGE DAILY TRAFFIC VOLUMES - EXISTING CONDITIONS

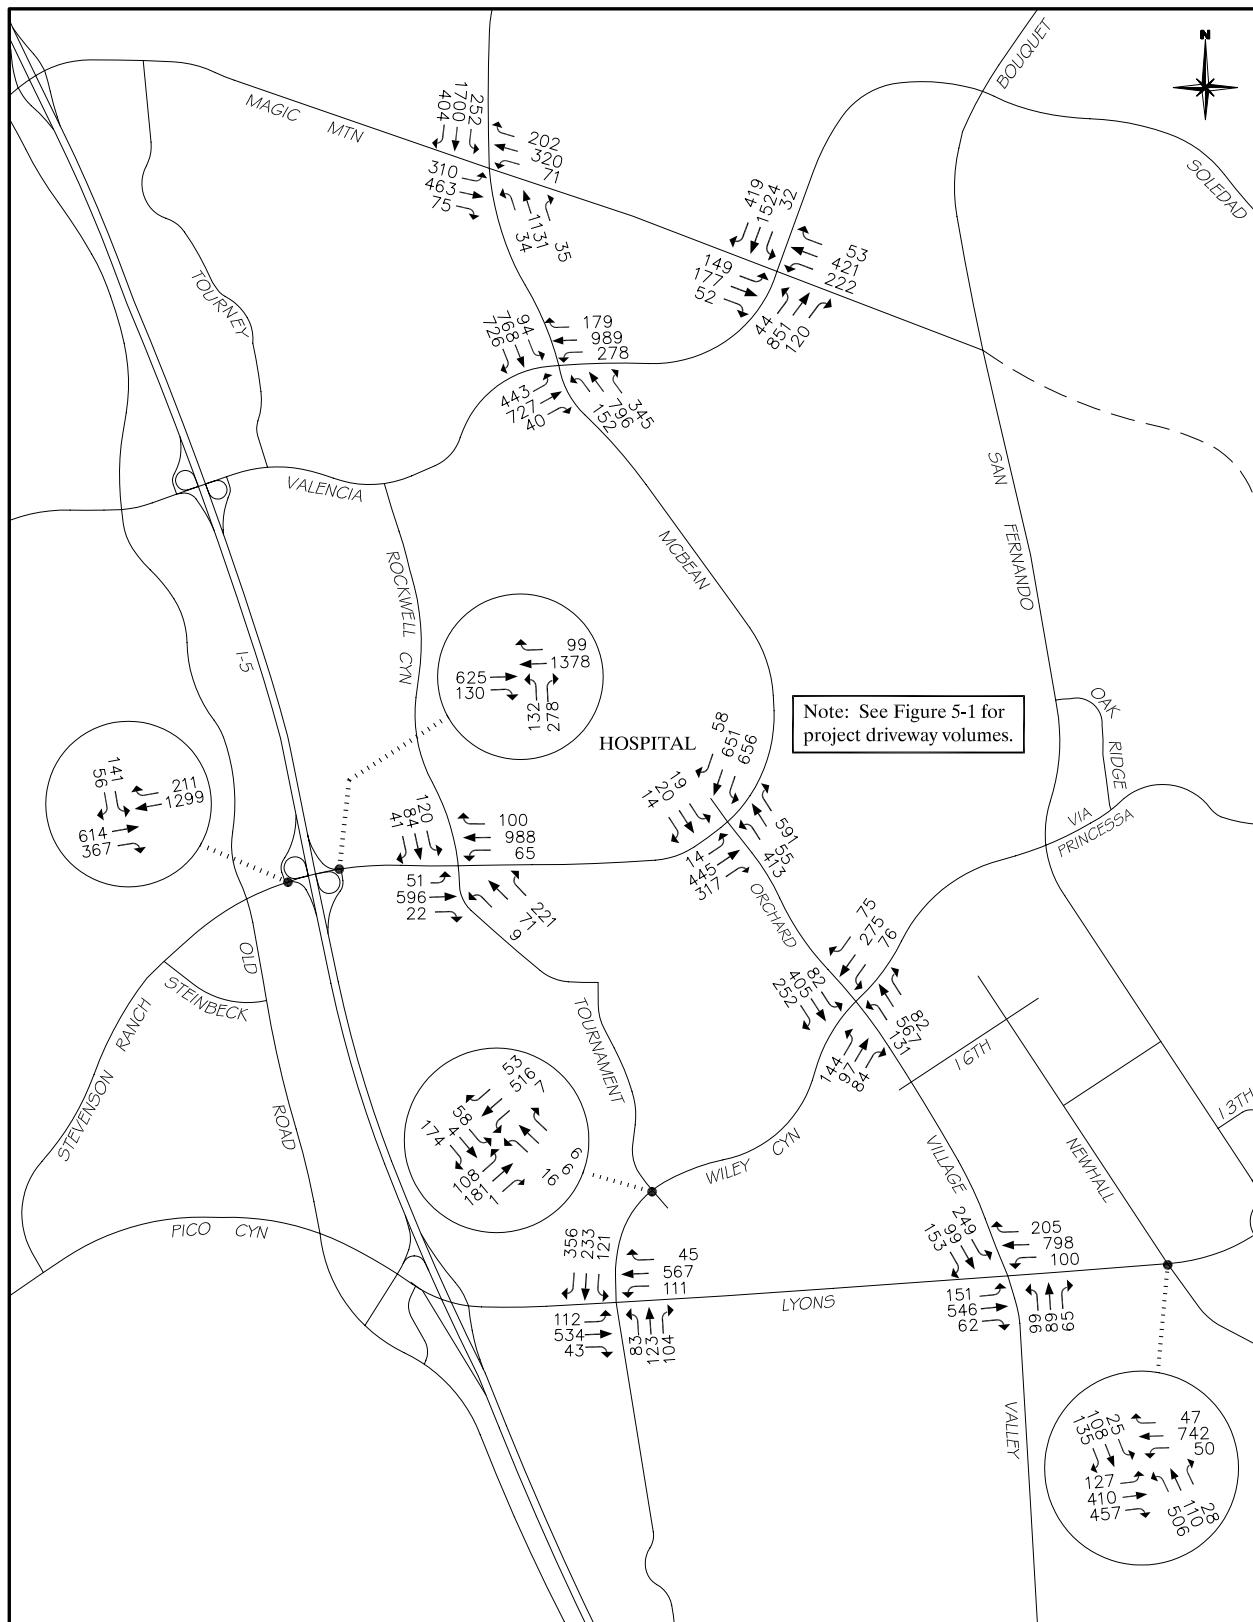

Figure 2-3

AM PEAK HOUR INTERSECTION VOLUMES
- EXISTING CONDITIONS

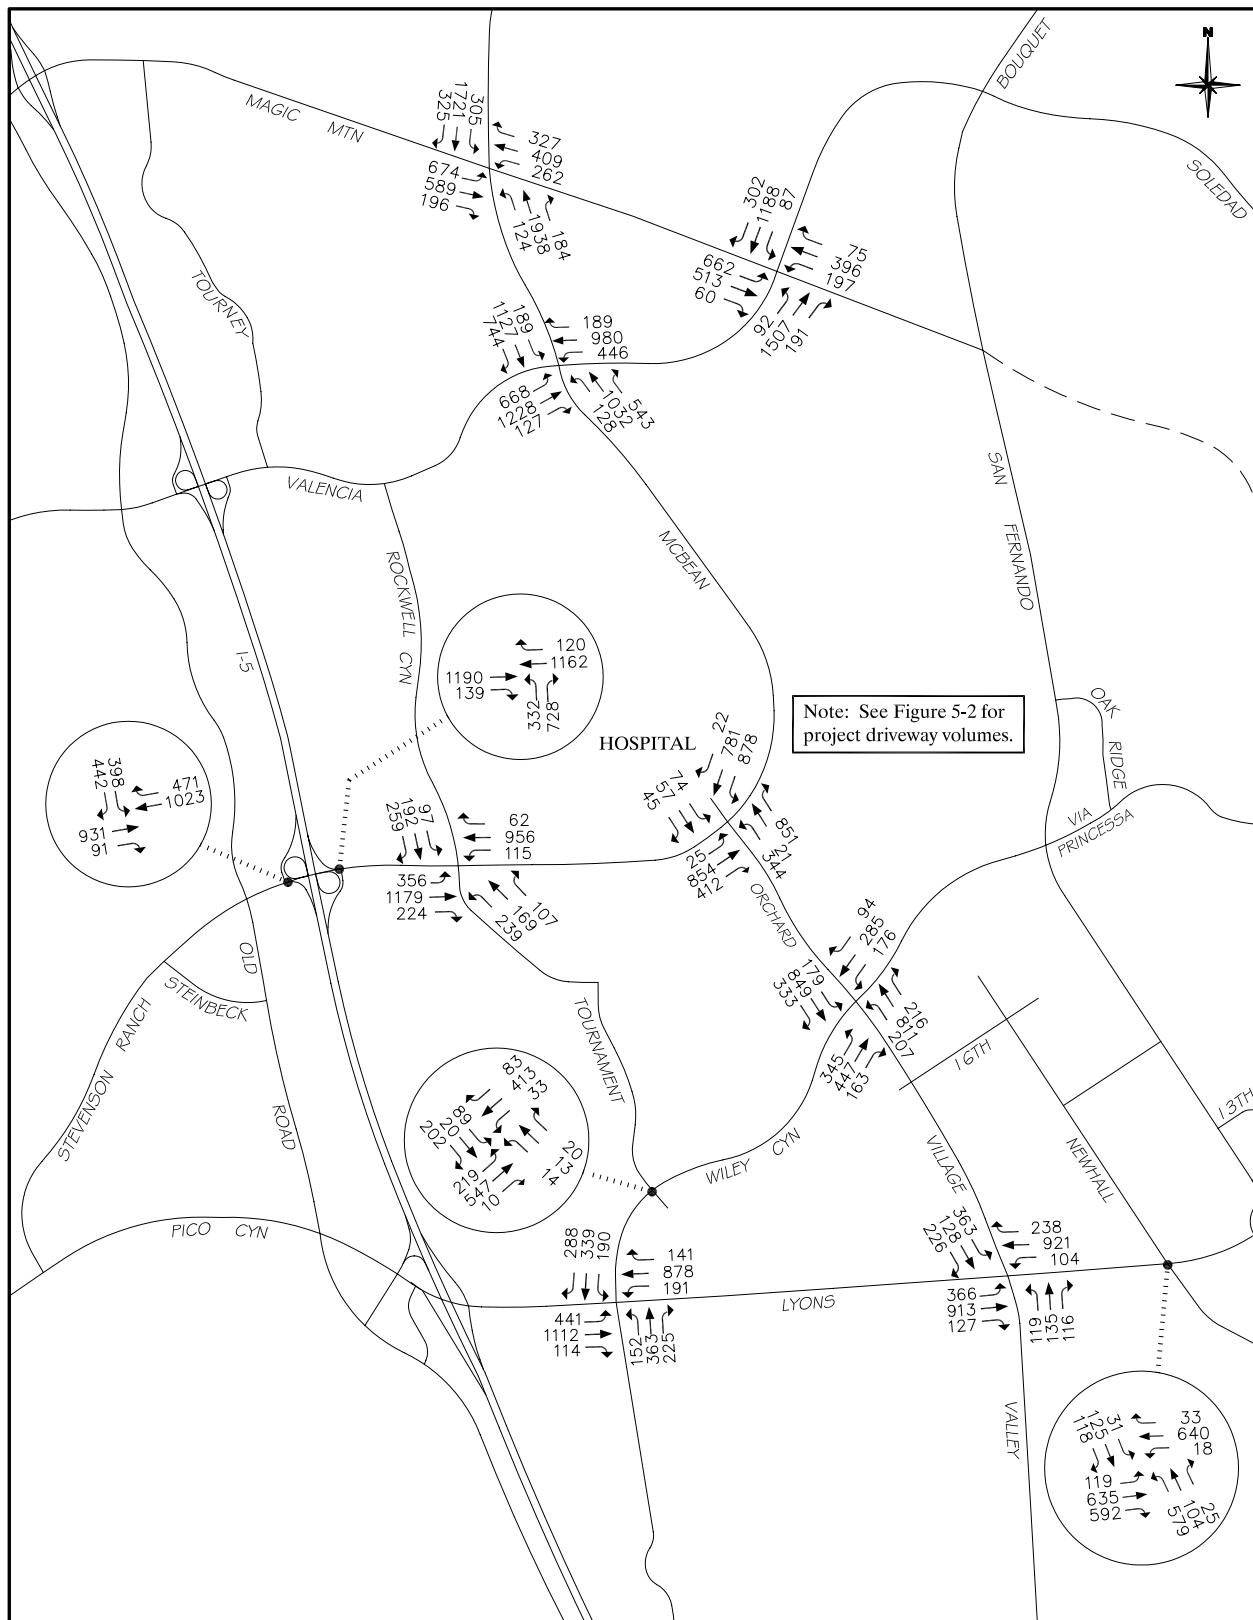

Figure 2-4

PM PEAK HOUR INTERSECTION VOLUMES
- EXISTING CONDITIONS

The data tabulated in Appendix C indicates that the average annual change in traffic volumes range from a decrease of 4 percent to an increase of 21 percent. The greatest increases occur in the Copper Hill/Rye Canyon Road area which is experiencing new development activity. Mature areas, such as the Orchard Village Road and Soledad Canyon Road areas show little to no increase in traffic volumes.

As discussed in the section on performance criteria in Chapter 1.0, level of service (LOS) is a concept developed to quantify the degree of comfort afforded to drivers as they travel on a given roadway. The degree of comfort includes such elements as travel time, number of stops, total amount of stopped delay, etc. As defined in the HCM 2000, six grades are used to denote the various LOS. The six are denoted A through F and a discussion on these was also given in Chapter 1.0.

The results of the ICU LOS analyses for the study area intersections are shown in Table 2-1 (ICU worksheets are provided in Appendix A). The table shows that each intersection currently meets the performance standard of the City.

2.1.3 Public Transportation

Santa Clarita Transit currently provides fixed-route transit immediately adjacent to the project site. Routes 5 and 6 pass through the intersection of Orchard Village Drive and McBean Parkway and provide service to the Stevenson Ranch Area, Hart High School, the Valencia Town Center and Canyon Country.

The nearest transit centers are the McBean Transfer Station (MTS), which is located on McBean Parkway approximately one mile north of the project site at the Valencia Town Center, and the Newhall Metrolink station located near Lyons Avenue.

2.2 INTERIM YEAR TRANSPORTATION SYSTEM

The Interim Year transportation system consists of roadway improvements and future infrastructure consistent with the cumulative projects included within the horizon year. Generally, this horizon year corresponds to a level of development approximately 10 to 15 years in the future. While this horizon does not coincide specifically with the buildout of the project, it represents the best timeframe for

Above 1.00 F					

planning purposes since it includes a comprehensive set of cumulative development projects that have been incorporated into the SCVCTM. With this, a conservative scenario is established for analyzing the impacts of the proposed project combined with projected and approved growth on a reasonably expanded circulation system.

Future roadways that affect the study area include the extension of Newhall Ranch Road east to Golden Valley Road/Soledad Canyon Road, the connection of Via Princessa between its current western terminus (near San Fernando Road) and its current eastern terminus (near Rainbow Glenn Drive), and the extension of Magic Mountain Parkway to Via Princessa (coinciding with the initial development of the Whitaker-Bermite Site).

2.3 LONG-RANGE CUMULATIVE ANALYSIS

The City's Circulation Element includes significant future roadway projects throughout the Valley that will affect traffic patterns of both existing and future trips. Future roadways such as the Via Princessa connection and Santa Clarita Parkway will have an effect on traffic volumes within the study area.

The I-5 freeway is part of a recent study prepared by the Los Angeles County Metropolitan Transportation Authority (Metro) and Caltrans (see Reference 10 in Section 1.6) in which it was recommended that the I-5 corridor between SR-14 and SR-126 West will ultimately double from the current four lanes in each direction to eight lanes in each direction. Two of the eight lanes would be for high occupancy vehicles (HOVs), two lanes for trucks, and four lanes for general use. A project is currently in the development stages that will add truck climbing lanes to the I-5 segment between SR-14 and Calgrove Boulevard as well as one HOV lane in each direction through the entire Santa Clarita Valley.

3.0 PROJECT DESCRIPTION

This chapter describes the project in terms of its transportation characteristics. Land use and trip generation for the project is summarized and the distribution of project trips on the study area roadway network is presented.

3.1 PROJECT OVERVIEW

The project site is generally located north of the intersection of Orchard Village Drive and McBean Parkway, and is one mile east of the Interstate 5 (I-5) freeway in the City of Santa Clarita. The project area is within the existing HMNMH medical campus located at 23845 McBean Parkway and is generally surrounded by residential uses. The location of the site in relation to the surrounding roadway system was illustrated in Chapter 1.0.

Currently, the project site is developed with the existing HMNMH medical campus as illustrated in Figure 3-1. The project proposes to increase the existing square footage of the hospital campus (30.39 acres) from 332,992 square feet to 660,355 square feet, a 327,363 square-foot increase. The 327,363 square-foot total for the proposed HMNMH Master Plan buildings is comprised of the following:

Inpatient Building A (IBA)	125,363 square feet
Medical Office Building 1 (MOB 1)	80,000 square feet
Medical Office Building 2 (MOB 2)	60,000 square feet
Medical Office Building 3 (MOB 3)	60,000 square feet
Central Plant	10,000 square feet
Foundation Building (to be demolished)	(8,000 square feet)

As shown above, the net build out of the medical campus totals results in 127,363 square feet of new hospital area and 200,000 square feet of new medical office area. Figure 3-2 illustrates the proposed site plan.

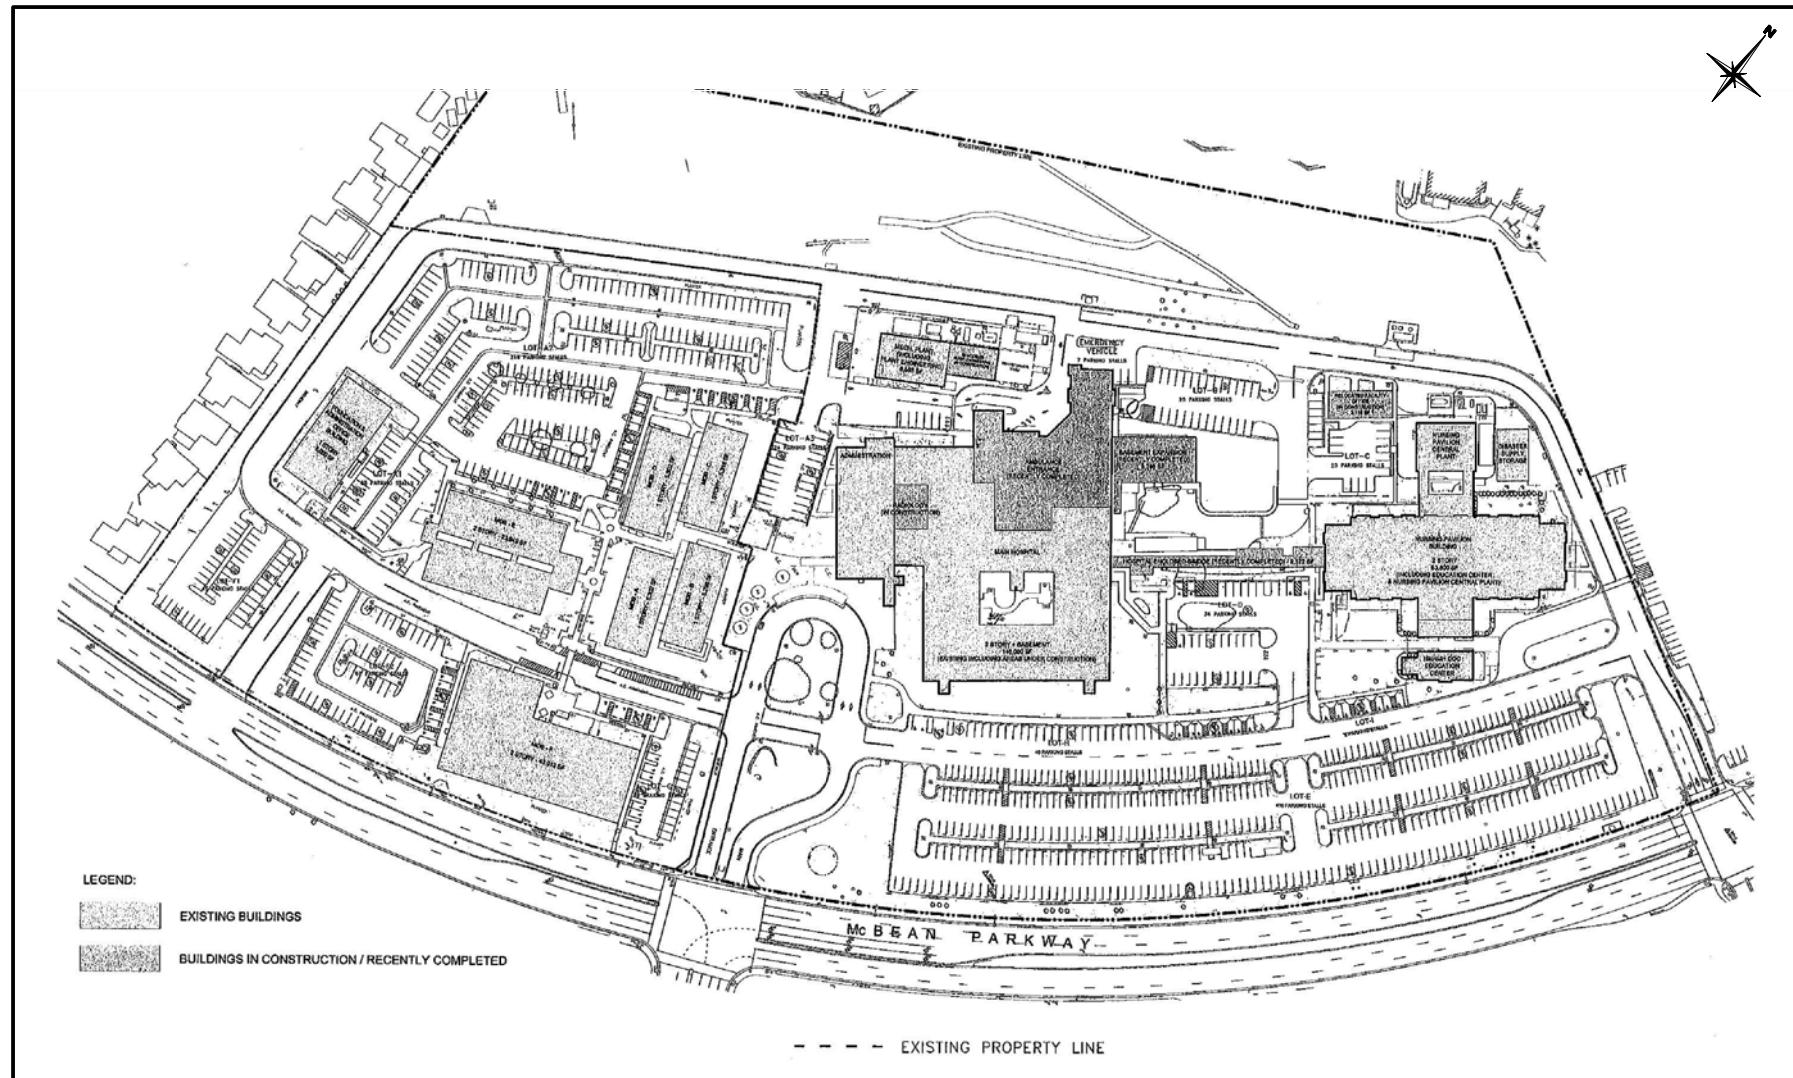

Figure 3-1
EXISTING CAMPUS MASTER PLAN

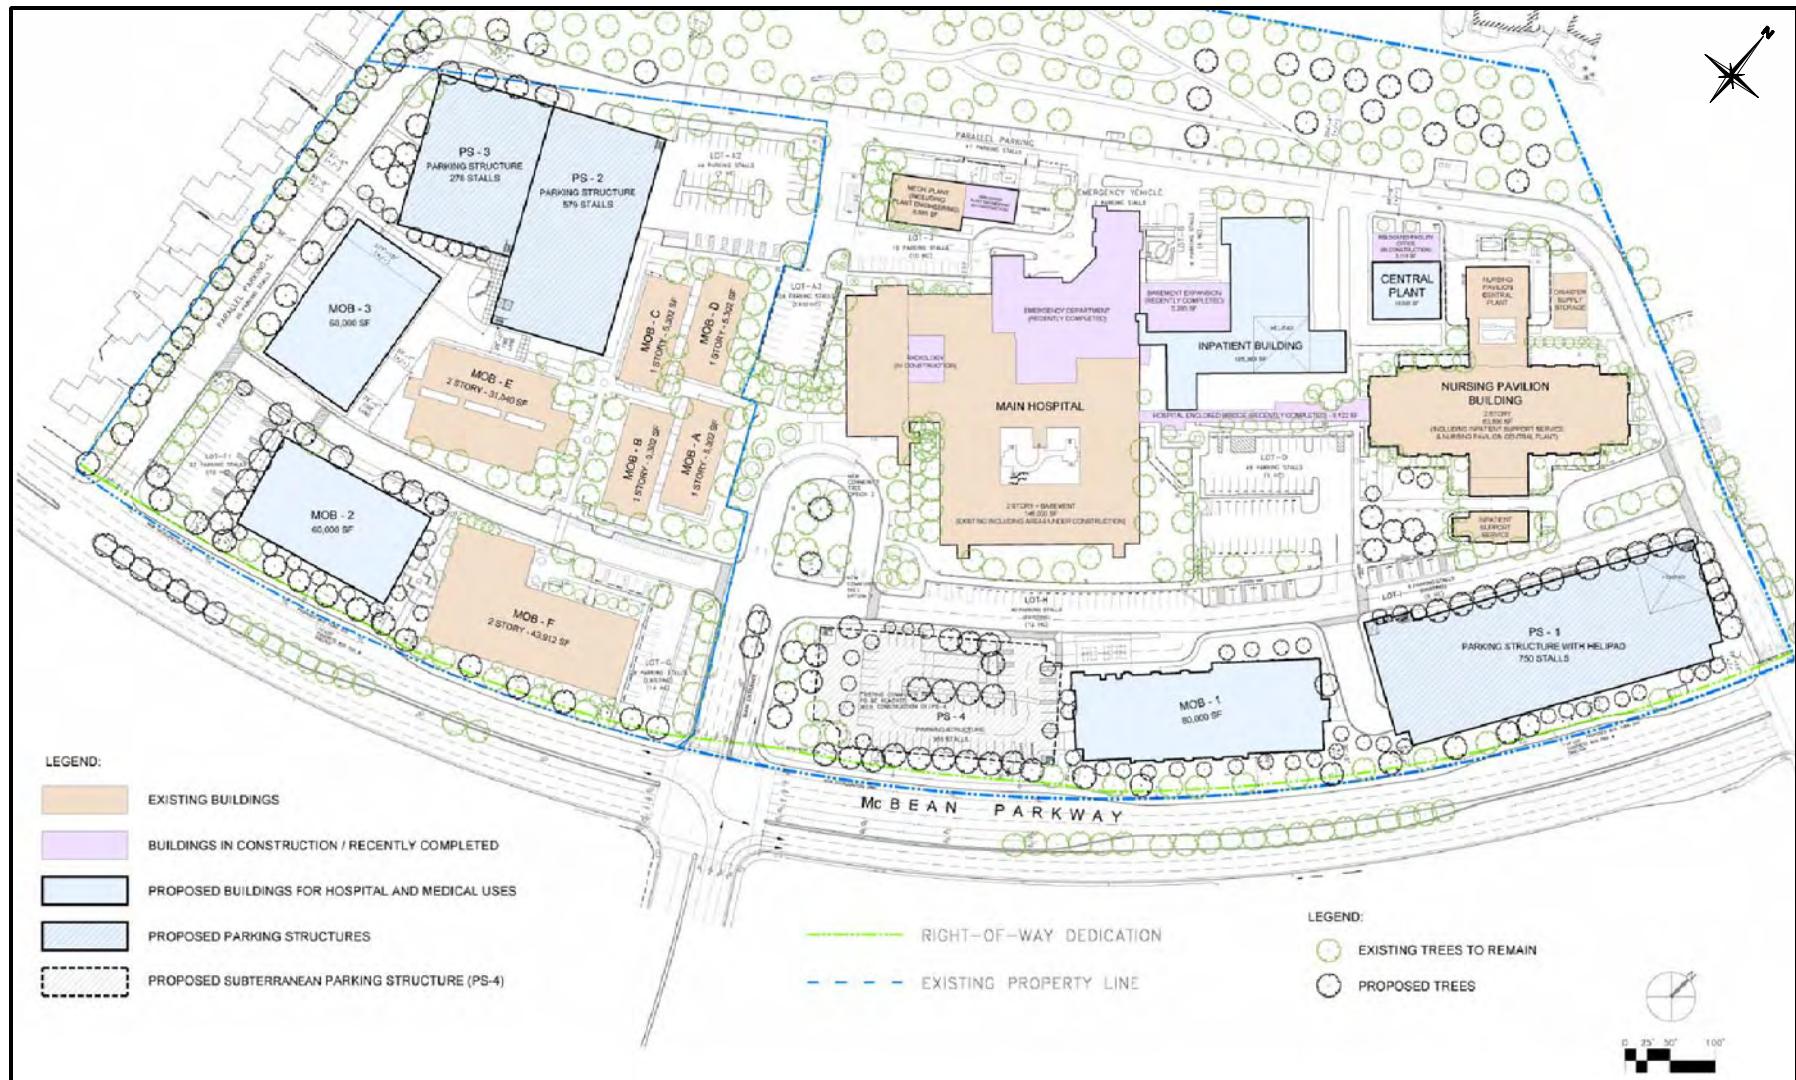

Figure 3-2
PROPOSED CAMPUS MASTER PLAN (PROJECT)

Access for the site is via five project driveways located on McBean Parkway. The main entrance for the project is provided at a four-way signalized intersection with Orchard Village Drive. Orchard Village Drive is a four-lane roadway in the vicinity of the project and terminates at the project entrance. A second four-way signalized intersection with McBean Parkway is located at Avenida Navarre, a two-lane local street serving the residential uses south of the project boundary. Three tee-intersections (project driveways) are located along McBean Parkway, one west of the Orchard Village Drive main entrance which provides full access and two east of the Avenida Navarre entrance which provide limited access.

3.2 PROJECT TRIP GENERATION

Land use and trip generation estimates for the proposed project are shown in Table 3-1. Trip generation is calculated using published data from the Institute of Transportation Engineers (ITE), Seventh Edition, “Trip Generation Manual” (see Reference 2 in Section 1.6). Trip generation estimates by building are shown in Table 3-2, which become relevant for Chapter 6.0 for the phasing of project mitigation measures.

The volume of trips calculated by the ITE trip rates represents the total number of trips for each unique use of the site (i.e., hospital and medical office), as if the uses were stand-alone facilities. Since these uses share a common site, one component of the total trip generation represents the trips between the hospital and the medical offices, which in some cases can be quite substantial. For example, actual field measurements of the existing HMNMH site showed that this on-site trip capture can represent as much as one-third of the total trip generation, as shown in Table 3-2. Since the project’s proposed Master Plan land use retains the mix of hospital and medical office facilities, future on-site trip capture is accounted for in the traffic forecasts using a factor of 20 percent, which is a more conservative estimate than the on-site trip capture that has been observed as occurring today. A conservative factor of 20 percent was determined as appropriate since it accounts for the on-site trip capture known to occur while still providing a margin of safety in regards to determining capacity needs for the site and City roadways.

Off-site estimates are used in this analysis to represent the project’s impacts on the analysis area circulation system. The off-site ADT volume of approximately 7,571 ADT represents 80 percent of the project total (with 20 percent remaining on-site as trips between the hospital and medical offices as discussed above). In the AM and PM peak hours, the off-site volumes of 519 (429 inbound) and 715 (554 outbound), respectively, are also 80 percent of the peak hour totals.

3.3 PROJECT TRIP DISTRIBUTION

The geographic distribution of project-generated trips was determined using the SCVCTM. The Interim Year version of the SCVCTM provided the background conditions for a select zone run, with adjustments made to the modeled volumes to account for the specific trip generation characteristics of the ITE trip rates noted in the previous section. The model takes into account the specific type of land use proposed for the site and how that land use would interact with the other land uses in the City.

The volumes presented in this section represent the net volume of off-site trips and do not include the on-site trips discussed in Section 3.2. Figures 3-4 and 3-5 illustrate the project-generated trips for the AM and PM peak hours, respectively, for the study area intersections. Figure 3-6 illustrates the distribution percentages together with the project-generated average daily trips (ADT) for the project. Since the SCVCTM performs separate assignments for the AM peak hour, the PM peak hour and the off-peak period, the specific volumes for any individual time period will not precisely match the values noted in the distribution percentages.

Approximately 49 percent of the trips generated by the project are assigned west of the project via McBean Parkway and approximately 25 percent of the trips are assigned to the east along McBean Parkway. South of the project, approximately 26 percent of the trips are assigned to Orchard Village Road. Approximately 23 percent of the trips are ultimately assigned to the I-5 freeway (11 percent north of McBean Parkway and 12 percent south of McBean Parkway) while the remainder of the trips utilize arterial roadways in the Santa Clarita Valley.

When using a traffic-forecasting model to produce future traffic projections with and without a proposed land use development project, separate “runs” of the traffic model are typically performed with and without the project. These separate runs assume that no changes occur to the surrounding land uses or to traffic generation within or beyond the study area, other than on the project site. Hence, while there is a net increase in trip generation locally due to the project, many trips within the study area are redirected to the project site and therefore are not necessarily “new” trips as far as the study area circulation system is concerned. In other words, the project traffic is not merely added to no-project traffic conditions by the model, but instead the project trips interact with surrounding land uses in a manner that changes the distribution patterns of non-project trips.

Figure 3-5

ADT VOLUMES - PROPOSED PROJECT

In order to reflect the interaction that would occur between existing development, the proposed project, and all other approved and unapproved future cumulative development that is forecast by the long-range cumulative (2030) buildout version of the SCVCTM, separate traffic model runs were prepared for the no-project and with-project settings as discussed above. These separate model runs result in the redistribution patterns that will occur due to the project and they are discussed in Chapter 4.0.

4.0 IMPACT ANALYSIS

This chapter addresses the traffic impacts of the proposed project. Traffic conditions with and without the proposed project are described in the following sections. Project impacts are identified using the criteria outlined in Chapter 1.0.

4.1 INTERIM YEAR ANALYSIS

The Interim Year traffic conditions are based on the SCVCTM forecasts described in Section 2.2. This setting forms the basis for identifying the potential peak hour traffic impacts of the proposed project at the study area intersections identified in Chapter 1.0. The following sections discuss Interim Year no-project and with-project conditions.

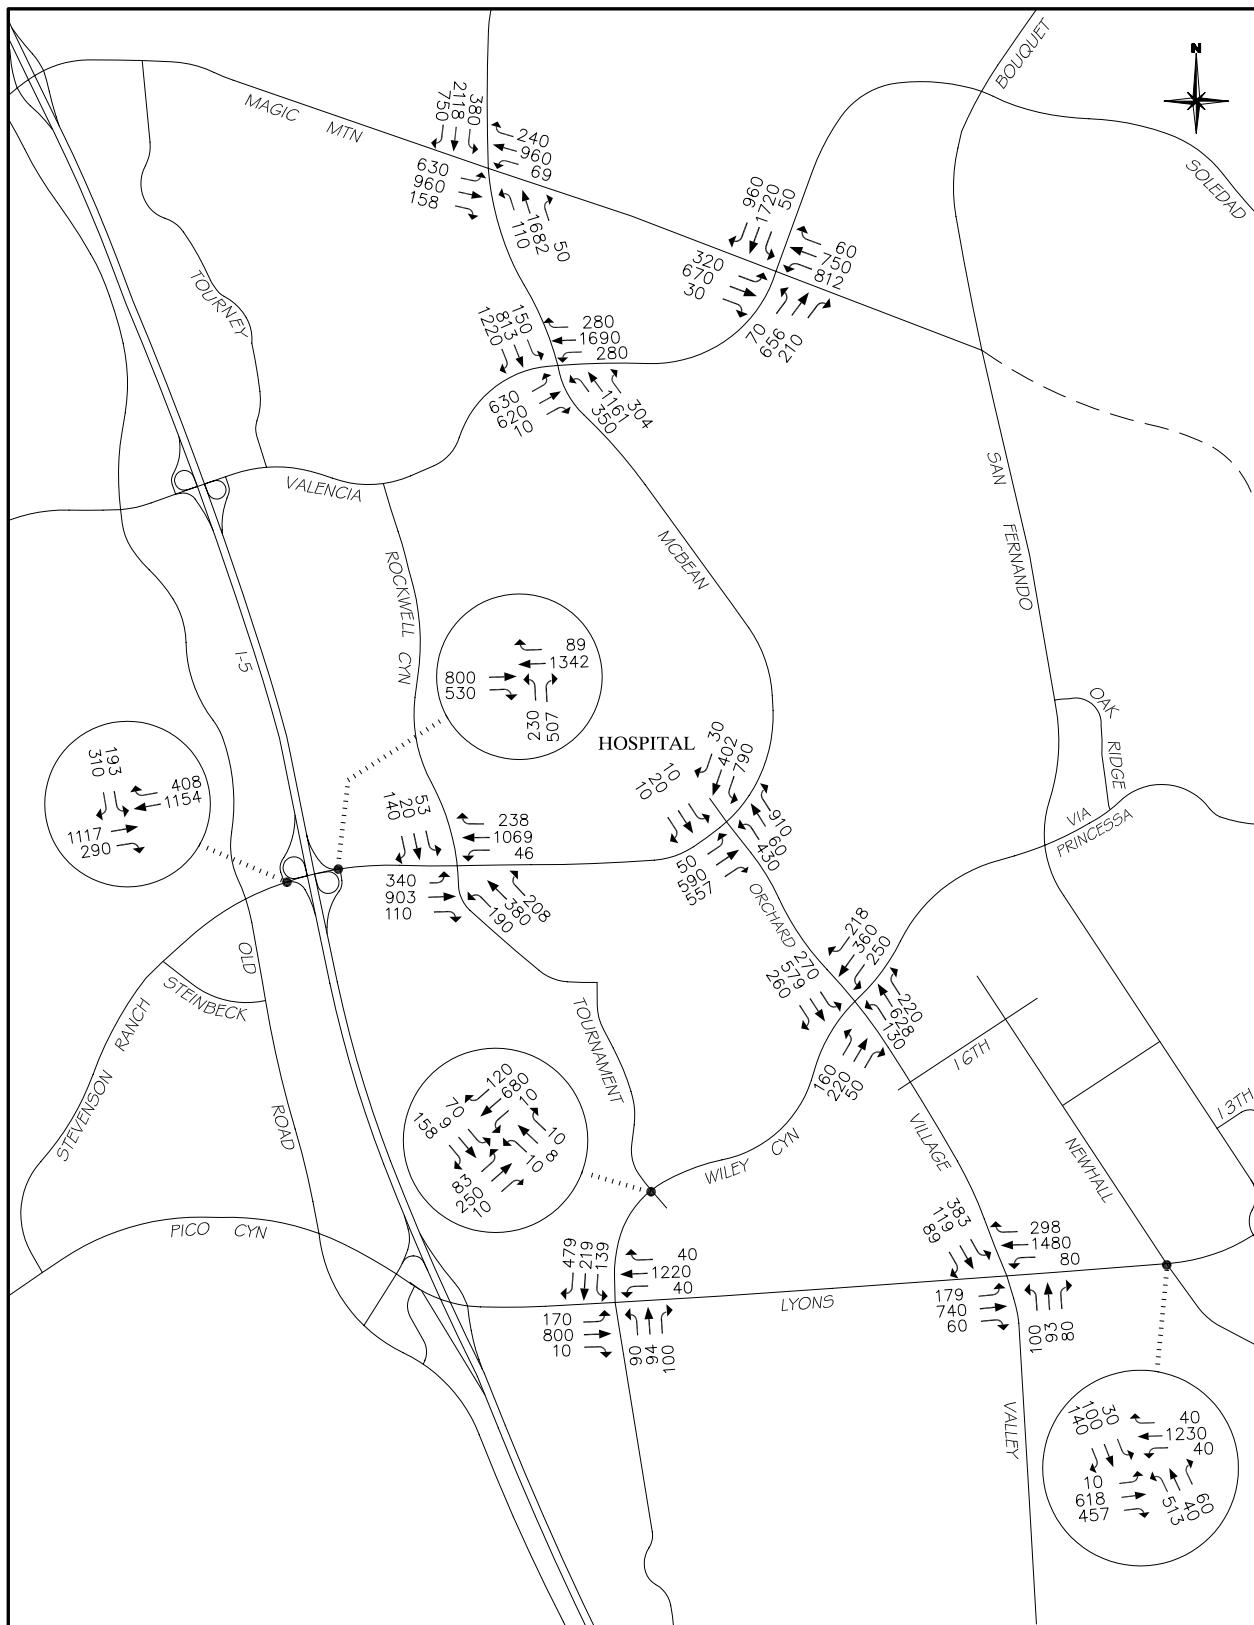

4.1.1 Interim Year No-Project Traffic Conditions

The Interim Year (no-project) peak hour turning movement volumes for the intersections in the study area are illustrated in Figures 4-1 and 4-2 for the AM and PM peak hours, respectively. These volumes include the existing land uses located on the project site. Interim Year ADT volumes for no-project conditions are illustrated in Figure 4-3.

4.1.2 Interim Year With-Project Traffic Conditions

The project impacts have been determined based on comparing a “no-project” condition, which is based on the project sites current uses (see previous section), and a “with-project” condition that was derived by adding the proposed hospital and medical office expansion to the model.

As shown in Chapter 3, the project represents a net increase (when compared to existing) of 7,571 ADT and peak hour increases of approximately 519 AM trips (429 inbound) and 715 PM trips (554 outbound). Illustrations of Interim Year (with project) peak hour intersection volumes are provided in Figures 4-4 and 4-5 for the AM and PM peak hours, respectively. Interim Year ADT volumes for with-project conditions are illustrated in Figure 4-6.

Figure 4-6

ADT VOLUMES - INTERIM YEAR WITH PROJECT

Peak hour ICU values can be found in Table 4-1 which provides a comparison between Interim Year no-project and with-project conditions (see Appendix A for the corresponding ICU worksheets). Given the City's significant impact criteria, significant impacts of the proposed project have been identified for the following four locations for Interim Year conditions:

- McBean Parkway at Magic Mountain Parkway
- Orchard Village Road at Wiley Canyon Road
- Orchard Village Road at McBean Parkway
- Valencia Boulevard at Magic Mountain Parkway

Mitigation that addresses these impacts is presented in Chapter 6.0.

4.2 LONG-RANGE CUMULATIVE (2030) BUILDOUT ANALYSIS

The Long-Range Cumulative (2030) Buildout traffic conditions are based on the long-range setting described in Section 2.4. This setting includes the buildout of the City's General Plan, including the Circulation Element, and forms the basis for identifying the potential traffic impacts of the proposed project.

The following sections discuss the long-range no-project and with-project conditions.

4.2.1 Long-Range Cumulative No-Project Traffic Conditions

The ADT volumes for the long-range cumulative (no-project) conditions are illustrated in Figure 4-7. These volumes include the existing land uses located on the project site.

4.2.2 Long-Range Cumulative With-Project Traffic Conditions

As discussed in Chapter 3.0, the proposed project will generate approximately 7,571 vehicle trips per day. This is the forecast used to represent the project's off-site impacts on the analysis area circulation system. The ADT volumes for the long-range cumulative conditions with the proposed project are illustrated in Figure 4-8. (The project-generated volumes were given previously in Chapter 3.0).

Figure 4-8

ADT VOLUMES
- LONG-RANGE CUMULATIVE WITH PROJECT

As discussed in Chapter 3, a redistribution of non-project traffic occurs when project-generated traffic is added to the circulation system and interacts with the surrounding land uses. The result is a change of travel patterns for some trips that will be occurring with or without the project in place. That is, some existing trips are redistributed to the project site from other similar locations, as well as some non-project trips that will change travel routes due to the influence of the new project traffic. This results in a net change in traffic volume on the arterial roadway system that is less than the gross amount of new trips generated by the project. This net change, which is due to the addition of the hospital Master Plan Buildout (project-generated) trips, is illustrated in Figure 4-9 in the form of ADT.

Table 4-2 summarizes the total roadway ADT volumes for the long-range cumulative time frame, both with and without project-generated traffic. Also shown here are the number of traffic lanes, roadway capacities and levels of service for each roadway section based on buildout of the City's Circulation Element. As shown in the table, multiple roadway segments do not achieve the City's target level of service of D for the projected total daily traffic volumes.

Following is a list of roadways that show a measurable change due to the proposed project and result in the roadway exceeding the target level of service of D for long-range cumulative (2030) buildout conditions.

- McBean Parkway between I-5 NB Ramps and Rockwell Canyon Road
- Valencia Boulevard between McBean Parkway and Citrus Drive

Since the defining capacity limitation of an urban arterial roadway is the capacity of its intersections, major intersections within the roadway segments listed above have been evaluated in regards to peak hour performance. Peak hour intersection performance is also the criteria used by the City to define significant project impacts. This intersection evaluation is based on buildout of the arterial roadway network as outlined in the Circulation Element of the City's General Plan, and the purpose is to identify locations where the proposed project may result in significant impacts in a long-range setting. The results are summarized in Table 4-3, which shows that during the critical peak hour time periods, the following two locations are significantly impacted by the proposed project.

- McBean Parkway at Valencia Boulevard
- Orchard Village Road at McBean Parkway

Mitigation that addresses these impacts is presented in Chapter 6.0.

5.0 SPECIAL ISSUES

This chapter includes additional analyses, such as a review of site circulation, a Congestion Management Program (CMP) analysis, a McBean Corridor operational analysis, and information regarding the proposed project's use of state highways.

5.1 SITE CIRCULATION

Chapter 3 presented an illustration of the proposed site plan. The plan indicates that access to the Master Plan portion of the site is provided by three project driveways located on McBean Parkway. The main entrance for the project is provided at a four-way signalized intersection with Orchard Village Drive. Orchard Village Drive is a two-lane roadway in the vicinity of the project and terminates at the project entrance. A second four-way signalized intersection with McBean Parkway is located at Avenida Navarre, a two-lane local street serving the residential uses south of the project boundary. Three tee-intersections (project driveways) are located along McBean Parkway, one west of the Orchard Village Drive main entrance (full access) and two east of the Avenida Navarre entrance (partial access). The two driveways east of Avenida Navarre access the non-master plan portion of the site.

5.1.1 Site Access – Existing Conditions

Illustrations of existing peak hour turning movement volumes for each project driveway can be found in Figures 5-1 and 5-2 for the AM and PM peak hours, respectively. The peak hour counts were collected in January 2005. The existing lane configurations are illustrated in Figure 5-3.

The results of the ICU LOS analyses for the full access project driveways are shown in Table 5-1 (ICU worksheets are provided in Appendix A). The table shows how each intersection currently meets the performance standard of the City. Future conditions at the access locations are discussed in the following section.

Above 1.00	F

5.1.2 Site Access – Future Conditions

Illustrations of future peak hour turning movement volumes for Interim Year conditions for each project driveway can be found in Figures 5-4 and 5-5 for the AM and PM peak hours, respectively.

The increase in traffic volume that is associated with the expansion of the hospital and medical office facilities will require improvements to each intersection that provides access to the hospital site. The recommended lane configurations for accommodating project traffic and the recommended lane configurations for the project site are illustrated in Figure 5-6. Following is a description of the recommended lane configurations for these scenarios.

Hospital Main Entrance/Orchard Village Road at McBean Parkway – This intersection represents one of two access locations controlled by a traffic signal. Improvements in the form of additional turn lanes and a longer left-turn lane storage pocket are recommended in order to accommodate the increase in traffic through this intersection.

As indicated in the previously referenced figures, a separate right-turn lane for vehicles turning into the site is recommended. The separate lane will allow vehicles turning into the site to slow to turning speed while out of the flow of the faster moving through traffic.

For vehicles exiting the site at this location, a total of three lanes were proposed to accommodate project traffic (one left-turn lane, one through lane and one shared through/right-turn lane). As shown in the impact analysis section (see Section 4.1) and in table above, this intersection is significantly impacted by the proposed project. Two mitigation measures have been identified (see Chapter 6.0 for discussion), the first of which consists of adding an additional (fourth) exit lane to the project driveway (one left-turn lane, two through lanes and one right-turn lane). The second mitigation measure consists of adding a separate eastbound right-turn lane on McBean Parkway (for right-turns from McBean Parkway to Orchard Village Road). Also, the existing left-turn storage pocket for turns from westbound McBean Parkway to southbound Orchard Village Road, which is of insufficient length to accommodate today's

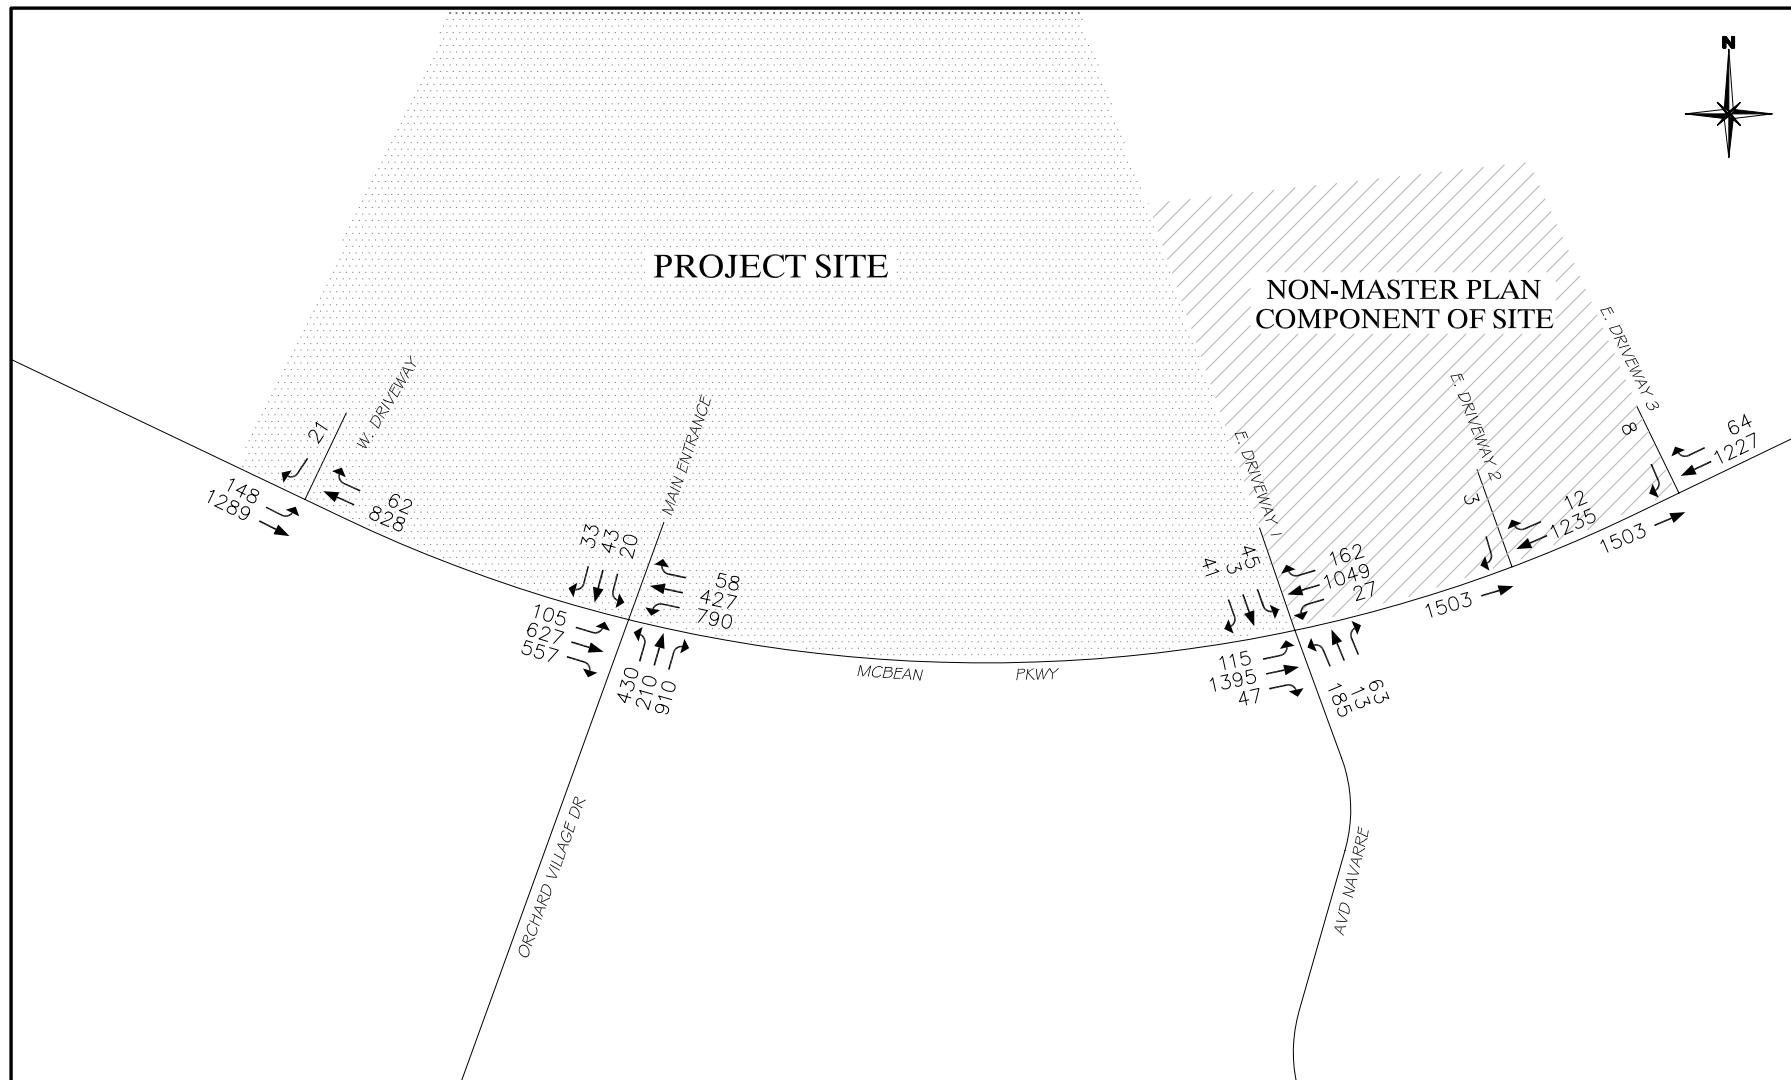

Figure 5-4

LEGEND

- ← Existing Lanes
- Future Lanes

Figure 5-6

INTERSECTION LANE CONFIGURATIONS
- PROJECT DRIVEWAYS

traffic volumes, is recommended to be lengthened to accommodate that movement's forecast 50th percentile queue length. The recommended turn pocket lengths are as follows:

Eastbound (McBean) Right-Turn Pocket (new) – 300 feet

Westbound (McBean) Left-Turn Pocket – 410 feet

Westbound (McBean) Right-turn Pocket (new) – 300 feet

Hospital Entrance/Avenida Navarre at McBean Parkway – This intersection represents the second of two access locations controlled by a traffic signal. The current configuration of this location provides sufficient capacity for the projected increase in traffic volumes, however, separate left-turn phasing is recommended to accommodate the increase of left-turn movements out of the site.

West Hospital Entrance at McBean Parkway – This intersection is not controlled by a traffic signal and will be relocated to the westerly boundary of the site as part of the proposed project. The relocated intersection will be approximately 675 feet west of the signalized McBean Parkway/Orchard Village Road intersection, which will preclude a traffic signal from being installed at the west driveway. Since McBean Parkway is a six-lane major arterial, it is recommended that left-turns out of the un-signalized driveway be prohibited, and that a separate right-turn lane be provided for vehicles turning into the site.

5.2 CMP ANALYSIS

The Los Angeles County Congestion Management Program (CMP) (see Reference 9 in Section 1.6) requires that a proposed development address two major subject areas with respect to traffic impacts. These are the project's impacts on the CMP highway system and on the local and regional transit systems.

According to the CMP guidelines, the geographical area examined in a CMP traffic impact analysis (TIA) consists of the CMP monitoring locations that meet the following criteria:

1. CMP intersections where the proposed project will add 50 or more trips during the AM or PM weekday peak hours (of adjacent street traffic).
2. Mainline freeway-monitoring locations where the project will add 150 or more trips, in either direction, during either the AM or PM weekday peak hours.

Only the CMP intersection of Magic Mountain Parkway and Valencia Boulevard meets the above criteria for the proposed project. The impact analysis in Chapter 4.0 shows that this intersection is significantly impacted by the proposed project and mitigation for the impact is presented in Chapter 6.0.

Another component of the CMP transportation impact analysis is a review of transit impacts. This review includes evidence that transit operators received the Notice of Preparation (included in the project EIR), identification of existing transit services near the project (see Section 2.1.3), estimation of the number of project trips assigned to transit, information on facilities and/or programs that will encourage public transit use, and an analysis of project impacts on transit service.

The proposed project is forecast to generate a net 7,571 ADT. The conversion to person trips is accomplished by using the CMP guidelines (multiplying the ADT by an occupancy factor of 1.4) which results in a total of 10,599 average daily person trips. To estimate the number of transit trips the CMP specifies a factor of 3.5 percent which results in 318 transit trips to be generated by Phase 1 of the proposed project.

5.3 STATE HIGHWAYS

5.3.1 Project Volumes

The project is located approximately 1 mile east of the I-5 Freeway. In the vicinity of the project, I-5 is an eight-lane freeway under the jurisdiction of Caltrans and will provide regional transportation for patrons of the proposed project. Project traffic will primarily utilize the McBean Parkway interchange for access to the project.

Table 5-2 summarizes the volume of project traffic forecast to use I-5 in the vicinity of the project site, based on the project distribution presented in Chapter 3.

Mainline	AM Peak Hour		PM Peak Hour	
	NB	SB	NB	SB
I-5 north of McBean Pkwy	11	47	55	17
I-5 south of McBean Pkwy	53	12	19	54
Ramps				
I-5 northbound off-ramp at McBean Pkwy	53	--	19	--
I-5 northbound on-ramp at McBean Pkwy	11	--	55	--
I-5 southbound off-ramp at McBean Pkwy	--	47	--	17
I-5 southbound on-ramp at McBean Pkwy	--	12	--	54

The affected segment of the freeway does not currently experience significant delay or unstable or forced flow conditions, and project traffic consists of only slightly more than 50 peak hour trips (e.g. 53 trips in the AM peak hour and 55 trips in the PM peak hour) on the segments nearest to the project site. The Caltrans “Guide for the Preparation of Traffic Impact Studies” (see Reference 4 in Chapter 1) indicates that a traffic impact study for the freeway mainline is not necessary when project volumes are less than 100 peak hour trips and freeway conditions are not exhibiting noticeable delay. This segment of the I-5 freeway is the subject of a recent traffic study which demonstrated that with the planned construction of truck climbing lanes and HOV lanes, the freeway will operate at acceptable levels of service for future cumulative conditions that include the project traffic (see Reference 11 in Section 1.6).

5.4 OPERATIONAL ANALYSIS

The impact analysis presented in the previous Chapter is based on determining level of service from the percent of intersection capacity that is being utilized by the forecast traffic volumes. That methodology is referenced by City’s traffic study guidelines and General Plan Circulation Element in regards to the determination of significant impacts. While that methodology is appropriate for quantifying the overall capacity utilization of an intersection, it does not address the more detailed aspects of intersection behavior such as delay and queue lengths for the individual movements or the effect of

upstream and downstream intersections. Therefore, while the methodology specified by the City's guidelines is used to determine project impacts, an operational analysis has been requested by City staff to provide information regarding the operational parameters anticipated to occur given the development of the project site.

The operational analysis procedures outlined in the 2000 Highway Capacity Manual (HCM) provides a methodology for calculating delay and queue for individual movements. To account for the effect of upstream and downstream conditions, a microscopic model which simulates the movement of individual vehicles through a network is required. For this analysis, forecast traffic volumes for Interim Year conditions with and without the proposed project have been evaluated using a micro-simulation model that incorporates delay and queue calculations based on the HCM procedures.

The detailed operational analysis was carried out for the McBean corridor between I-5 and Decoro Drive and for Orchard Village Road between McBean Parkway and Lyons Avenue. The following twenty-four (24) intersections represent each of the traffic signal controlled locations along these corridors:

- McBean Parkway and Decoro Drive
- McBean Parkway and Cottage Circle
- McBean Parkway and Fairview Drive
- McBean Parkway and Newhall Ranch Road
- McBean Parkway and Baywood Lane
- McBean Parkway and Avenue Scott
- McBean Parkway and Creekside Road
- McBean Parkway and Magic Mountain Parkway
- McBean Parkway and Town Center
- McBean Parkway and Mall Entrance
- McBean Parkway and Valencia Boulevard
- McBean Parkway and Del Monte Drive
- McBean Parkway and Arroyo Park Drive
- McBean Parkway and Granary Square
- McBean Parkway and Avd. Navarro/HMNMH Driveway
- McBean Parkway and Orchard Village Road/HMNMH Driveway

- McBean Parkway and Alegro Street
- McBean Parkway and Singing Hills Drive
- McBean Parkway and Rockwell Canyon Road
- Orchard Village and Mill Valley Road
- Orchard Village and Wiley Canyon Rd
- Orchard Village and Avenida Ronada
- Orchard Village and Dalbey Drive
- Orchard Village and Lyons Avenue

It is the operation of these signalized intersections that largely determine the quality of traffic movement through this corridor.

A delay and level of service summary by intersection is provided in Table 5-3 (see Appendix B for summary reports by intersection). For Interim Year conditions, the operations analysis shows that when project mitigation is implemented (see Chapter 6.0 for details of the mitigation measures) conditions are either LOS D or better, or if worse than LOS D, the mitigation improves operations in comparison to no-project conditions.

Values in parentheses represent conditions with the proposed project mitigation measures including signal timing adjustments.

6.0 MITIGATION

This chapter summarizes the mitigation measures identified in response to the significant impacts outlined in the previous chapters.

6.1 PROJECT MITIGATION

A mitigation phasing analysis has been conducted to determine both the type of mitigation measure that is needed as well as when the off-site intersection mitigation measures are required to be in place. In other words, the analysis identifies the specific mitigation measures that are needed as each of the proposed new buildings is constructed.

For the purpose of this analysis, the individual buildings were presumed to be constructed in the following order based on the anticipated occupancy dates provided by the project applicant: Medical Office Building (MOB) 1 (approximately 2010), Inpatient Building and/or MOB 2 (approximately 2013-2016), and MOB 3 (approximately 2019). The similarity between the amount of trips generated by MOB 2 and the Inpatient Building means that the Inpatient Building could be constructed before MOB 2, or vice versa, without significantly affecting the findings of this analysis.

An estimate of traffic conditions was prepared for each of the phases noted above. Buildout of the full project (approximately 2019) is evaluated based on forecasts from the Interim Year traffic model as discussed in Chapter 4.0. Background conditions for the preceding years (i.e., 2010 through 2016) were estimated by interpolating between existing conditions and the Interim Year conditions.

The impact analysis presented in Sections 4.1 and 4.2 determined that based on the City's impact criteria, a significant project impact occurs at the following intersections:

- McBean Parkway at Valencia Boulevard
- McBean Parkway at Magic Mountain Parkway
- Orchard Village Road at Wiley Canyon Road
- Orchard Village Road/Project Driveway at McBean Parkway
- Valencia Boulevard at Magic Mountain Parkway

Of these intersections, significant project impacts occur at four intersections with buildout of the proposed project and, in addition, two impacts were identified for long-range cumulative conditions (i.e., after the project is built-out), one of which is at the Orchard Village Road/McBean Parkway intersection and the other which is at the McBean Parkway/Valencia Boulevard intersection.

The project impacts can be mitigated by implementing the identified improvements in conjunction with the construction of the following buildings:

MOB 1 Mitigation (approximately 2010):

- **McBean Parkway at Magic Mountain Parkway (Intersection #45):** Add a third through lane for the westbound direction (re-striping) and add right-turn overlap phasing for the westbound right-turn movement (signal modification).
- **Orchard Village Road at Wiley Canyon Road (Intersection #54):** Add a separate northbound right-turn lane with right-turn overlap phasing (within existing right-of-way between Wiley Canyon road and the Santa Clara River South Fork Bridge).
- **Orchard Village Road at McBean Parkway (Intersection #55):** Widen the southbound approach (project driveway) to allow for a left-turn lane and a second through lane.

Inpatient Building/MOB 2 Mitigation (approximately 2013 - 2016):

- **McBean Parkway at Magic Mountain Parkway (Intersection #45):** Add a third through lane for the eastbound direction (re-striping).
- **Orchard Village Road at McBean Parkway (Intersection #55):** Add a separate westbound right-turn lane (for project access) and a separate southbound right-turn lane (project driveway).
- **Valencia Boulevard at Magic Mountain Parkway (Intersection #57): MOB** Add a second westbound left-turn lane by removing the existing right-turn lane (re-striping the westbound approach as a mirror image of the existing eastbound approach).

MOB 3 Mitigation (approximately 2019):

- **None**

As noted above, the project's traffic study identified two impacts for long-range cumulative conditions (approximately year 2030). These impacts are not anticipated to occur until after the buildout of the project itself (project buildout is approximately 2019). As such, the project is responsible for paying its fair-share of the cost of these two mitigation measures:

Mitigation of Long-Range Cumulative Impacts (After Project Buildout):

- **McBean Parkway at Valencia Boulevard (Intersection #44):** Add a fourth westbound through lane (requires the widening of Valencia Boulevard). The project's fair-share equals 4.3 percent of the cost of this improvement.
- **Orchard Village Road at McBean Parkway (Intersection #55):** Add a separate eastbound right-turn lane (requires the widening of McBean Parkway) & restripe hospital driveway to reconfigure the first through lane to a shared left-turn/through lane. The project's fair-share equals 30.5 percent of the cost of this improvement.

Table 6-1 summarizes the resulting ICU values with the above mitigation.

Table 6-1

Significant Impacts shown in **Bold**.

¹ Includes mitigation identified in previous phase(s).

²Buildout of the full project (approximately 2019) is evaluated based on forecasts from the Interim Year model as discussed in Chapter 4.0.

Level of service ranges: .00 - .60 A
.61 - .70 B
.71 - .80 C
.81 - .90 D
.91 - 1.00 E
Above 1.00 F

Table 6-2 summarizes the fair-share percentage of the mitigation for Long-Range Cumulative Impacts (after project buildout). The project has a 4.3% share of the long-range impact at the McBean Parkway/Valencia Boulevard intersection, and a 30.5% share of the long-range impact at the Orchard Village Road/McBean Parkway intersection.

SHARE SUMMARY							
Intersection	Existing Peak Hour Volumes		Long Range Cumulative With Project Peak Hour Volumes		Project Only Peak Hour Volumes		Share
	AM	PM	AM	PM	AM	PM	
44. McBean & Valencia	5,537	7,401	6,830	9,350	40	100	4.3%
55. Orchard Village & McBean	3,253	4,364	4,140	5,840	310	410	30.5%

6.2 BRIDGE AND THOROUGHFARE DISTRICT

The project will contribute to the established Valencia Bridge and Thoroughfare District in accordance with City policy.

APPENDIX A

INTERSECTION CAPACITY UTILIZATION WORKSHEETS

Peak hour intersection volume/capacity ratios are calculated by means of intersection capacity utilization (ICU) values. ICU calculations were performed for the intersections shown in Figure A-1.

The procedure is based on the critical movement methodology, and shows the amount of capacity utilized by each critical move. A "de-facto" right-turn lane is used in the ICU calculation for cases where a curb lane is wide enough to separately serve both through and right-turn traffic (typically with a width of 19 feet from curb to outside of through-lane with parking prohibited during peak periods). Such lanes are treated the same as striped right-turn lanes during the ICU calculations, but they are denoted on the ICU calculation worksheets using the letter "d" in place of a numerical entry for right-turn lanes.

The methodology also incorporates a check for right-turn capacity utilization. Both right-turn-on-green (RTOG) and right-turn-on-red (RTOR) capacity availability are calculated and checked against the total right-turn capacity need. If insufficient capacity is available, then an adjustment is made to the total capacity utilization value. The following example shows how this adjustment is made.

Example of Right-turn Capacity Utilization For Northbound Right

1. Right-Turn-On-Green (RTOG)

If NBT is critical move, then:

$$\text{RTOG} = V/C (\text{NBT})$$

Otherwise,

$$\text{RTOG} = V/C (\text{NBL}) + V/C (\text{SBT}) - V/C (\text{SBL})$$

2. Right-Turn-On-Red (RTOR)

If WBL is critical move, then:

$$\text{RTOR} = V/C (\text{WBL})$$

Otherwise,

$$\text{RTOR} = V/C (\text{EBL}) + V/C (\text{WBT}) - V/C (\text{EBT})$$

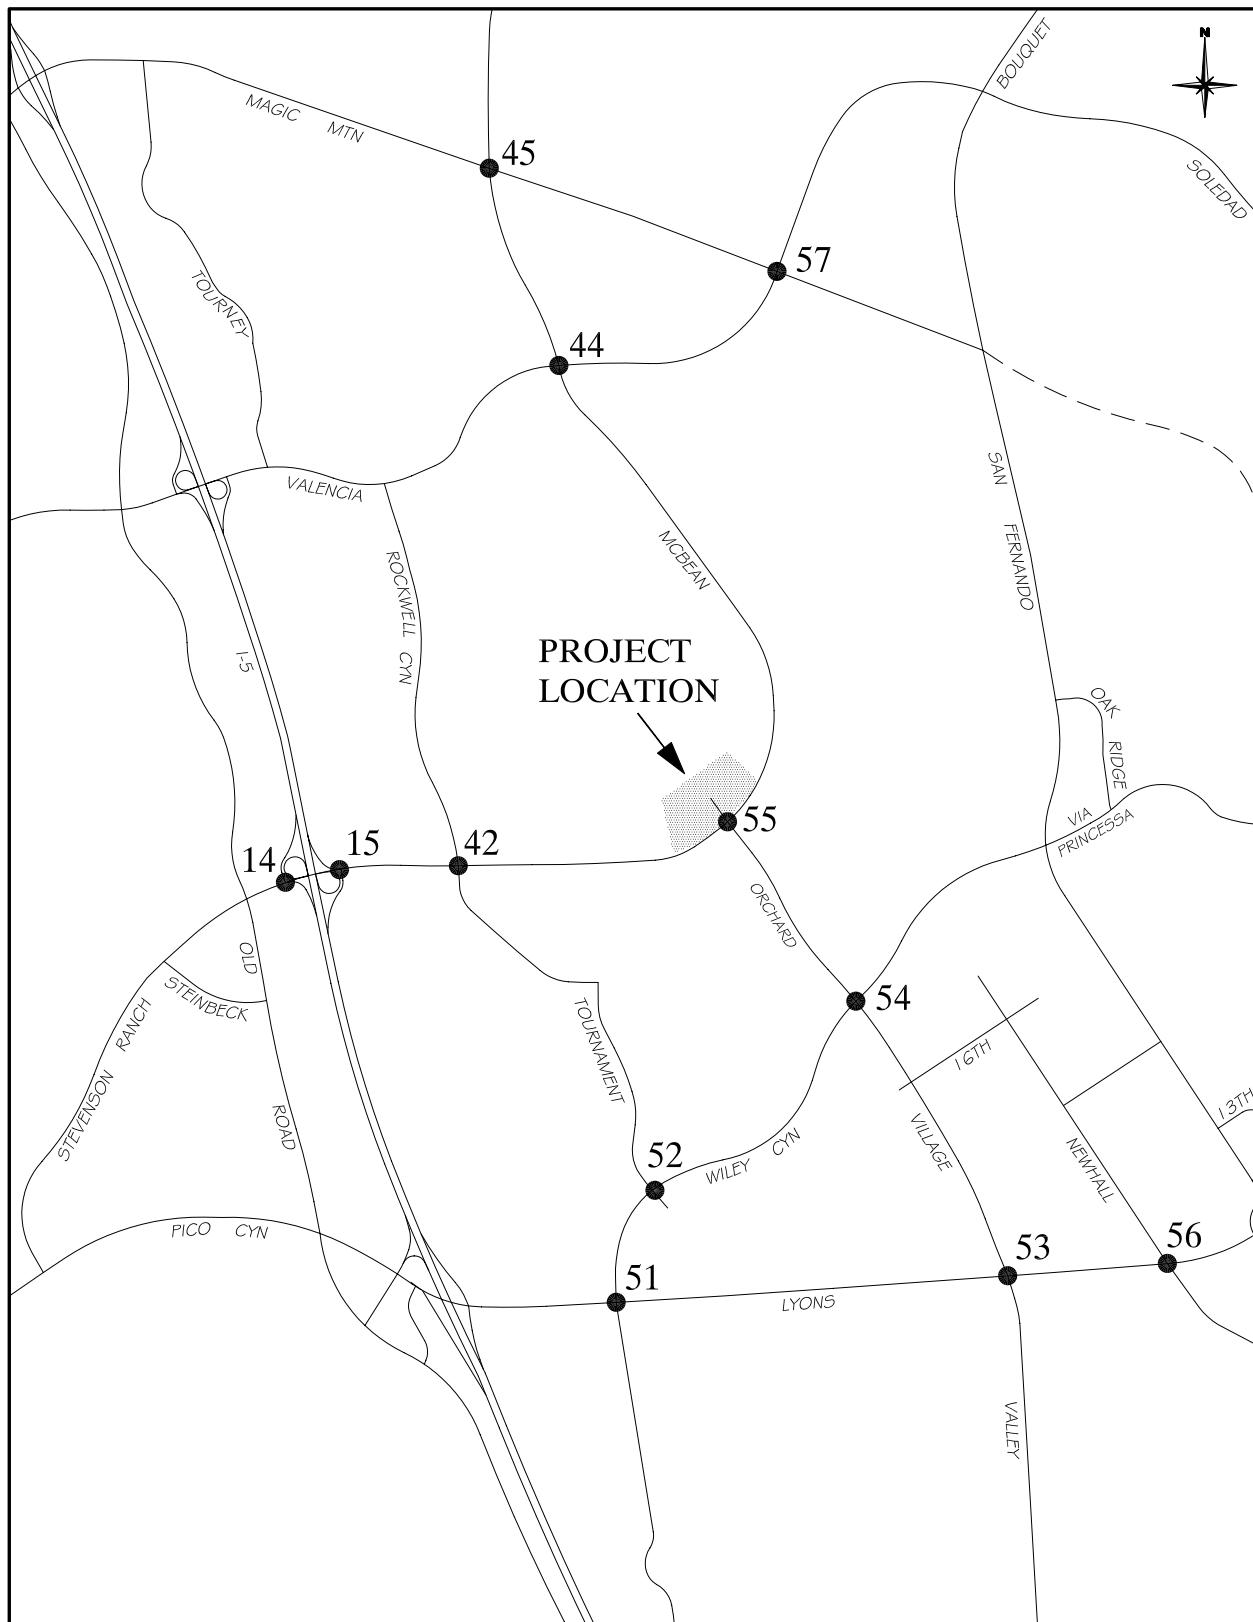

Figure A-1
INTERSECTION STUDY LOCATIONS

3. Right-Turn Overlap Adjustment

If the northbound right is assumed to overlap with the adjacent westbound left, adjustments to the RTOG and RTOR values are made as follows:

$$\begin{aligned} \text{RTOG} &= \text{RTOG} + \text{V/C (WBL)} \\ \text{RTOR} &= \text{RTOR} - \text{V/C (WBL)} \end{aligned}$$

4. Total Right-Turn Capacity (RTC) Availability For NBR

$$\text{RTC} = \text{RTOG} + \text{factor} \times \text{RTOR}$$

Where factor = RTOR saturation flow factor (typically 75%)

5. Right-turn Adjustment for ICU Calculation

Right-turn adjustment is then as follows: Additional ICU = V/C (NBR) - RTC

A zero or negative value indicates that adequate capacity is available and no adjustment is necessary. A positive value indicates that the available RTOR and RTOG capacity does not adequately accommodate the right-turn V/C, therefore the right-turn is essentially considered to be a critical movement. In such cases, the right-turn adjustment is noted on the ICU worksheet and it is included in the total capacity utilization value. When it is determined that a right-turn adjustment is required for more than one right-turn movement, the word "multi" is printed on the worksheet instead of an actual right-turn movement reference, and the right-turn adjustments are cumulatively added to the total capacity utilization value. In such cases, further operational evaluation is typically carried out to determine if under actual operational conditions, the critical right-turns would operate simultaneously, and therefore a right-turn adjustment credit should be applied.

Shared Lane V/C Methodology

For intersection approaches where shared usage of a lane is permitted by more than one turn movement (e.g., left/through, through/right, left/through/right), the individual turn volumes are evaluated to determine whether dedication of the shared lane is warranted to any one given turn movement. The following example demonstrates how this evaluation is carried out:

Example of Shared Lane Utilization for Shared Left/Through Lane

1. Average Lane Volume (ALV)

$$\text{ALV} = \frac{\text{Left-Turn Volume} + \text{Through Volume}}{\text{Total Left} + \text{Through Approach Lanes (including shared lane)}}.$$

2. ALV for Each Approach

$$\text{ALV (Left)} = \frac{\text{Left-Turn Volume}}{\text{Left Approach Lanes (including shared lane)}}.$$

$$\text{ALV (Through)} = \frac{\text{Through Volume}}{\text{Through Approach Lanes (including shared lane)}}.$$

3. Lane Dedication is Warranted

If ALV (Left) is greater than ALV then full dedication of the shared lane to the left-turn approach is warranted. Left-turn and through V/C ratios for this case are calculated as follows:

$$\text{V/C (Left)} = \frac{\text{Left-Turn Volume}}{\text{Left Approach Capacity (including shared lane)}}.$$

$$\text{V/C (Through)} = \frac{\text{Through Volume}}{\text{Through Approach Capacity (excluding shared lane)}}.$$

Similarly, if ALV (Through) is greater than ALV then full dedication to the through approach is warranted, and left-turn and through V/C ratios are calculated as follows:

$$\text{V/C (Left)} = \frac{\text{Left-Turn Volume}}{\text{Left Approach Capacity (excluding shared lane)}}.$$

$$\text{V/C (Through)} = \frac{\text{Through Volume}}{\text{Through Approach Capacity (including shared lane)}}.$$

4. Lane Dedication is not Warranted

If ALV (Left) and ALV (Through) are both less than ALV, the left/through lane is assumed to be truly shared and each left, left/through or through approach lane carries an evenly distributed volume of traffic equal to ALV. A combined left/through V/C ratio is calculated as follows:

$$V/C (\text{Left/Through}) = \frac{\text{Left-Turn Volume} + \text{Through Volume}}{\text{Total Left} + \text{Through Approach Capacity (including shared lane)}}.$$

This V/C (Left/Through) ratio is assigned as the V/C (Through) ratio for the critical movement analysis and ICU summary listing.

If split phasing has not been designated for this approach, the relative proportion of V/C (Through) that is attributed to the left-turn volume is estimated as follows:

If approach has more than one left-turn (including shared lane), then:

$$V/C (\text{Left}) = V/C (\text{Through})$$

If approach has only one left-turn lane (shared lane), then:

$$V/C (\text{Left}) = \frac{\text{Left-Turn Volume}}{\text{Single Approach Lane Capacity}}.$$

If this left-turn movement is determined to be a critical movement, the V/C (Left) value is posted in brackets on the ICU summary printout.

These same steps are carried out for shared through/right lanes. If full dedication of a shared through/right lane to the right-turn movement is warranted, the right-turn V/C value calculated in step three is checked against the RTOR and RTOG capacity availability if the option to include right-turns in the V/C ratio calculations is selected. If the V/C value that is determined using the shared lane methodology described here is reduced due to RTOR and RTOG capacity availability, the V/C value for the through/right lanes is posted in brackets.

When an approach contains more than one shared lane (e.g., left/through and through/right), steps one and two listed above are carried out for the three turn movements combined. Step four is carried out if dedication is not warranted for either of the shared lanes. If dedication of one of the shared lanes is warranted to one movement or another, step three is carried out for the two movements involved, and then steps one through four are repeated for the two movements involved in the other shared lane.

APPENDIX C

TRAFFIC COUNT COMPARISON

As noted in Section 2.1.2, Existing Traffic Volumes and Levels of Service, traffic counts were collected for the purpose of this study between May 2003 and January 2005. A subsequent comparison has been made to traffic counts collected between 2005 and 2007 to determine what changes to volumes and levels of service, if any, have occurred since the initial collection of traffic counts.

Table C-1 provides a comparison between the 2004 ADT counts illustrated in the traffic study and more recent ADT counts at locations where data for 2004 through 2007 is available. The table shows that at these locations, the average annual change in traffic volumes range from a decrease of 4 percent to an increase of 21 percent. The greatest increases occur in the Copper Hill/Rye Canyon Road area which is experiencing new development activity. Mature areas, such as the Orchard Village Road and Soledad Canyon Road areas exhibit little to no increase in traffic volumes.

Table C-2 provides a comparison between 2004/2005 peak hour intersection levels of service and 2006/2007 peak hour intersection levels of service for locations where recent data is available. The table shows that level of service during the AM peak hour remains in the range of LOS A & B, and during the PM peak hour level of service remains in the range of C & D. In the PM peak hour, two locations (McBean Parkway at Magic Mountain Parkway and Wiley Canyon Road at Lyons Avenue) show an improvement in level of service, and one location (Valencia Boulevard at Magic Mountain Parkway) shows a worsening of level of service from LOS C to LOS D.

Table C-1

ADT COMPARISON – 2004, 2005 AND 2007 COUNTS

Location	2004	2005	2007	Average Annual Increase
Copper Hill n/o Newhall Ranch	28	34		21%
Lyons e/o Orchard Village	34		47	13%
Rye Canyon s/o Scott	37	41		11%
Whites Canyon s/o Soledad Canyon	29	32		10%
Newhall Ranch e/o Rye Canyon	10	11		10%
Orchard Village s/o McBean Parkway	29		30	1%
Soledad Canyon e/o Bouquet Canyon	57	57		0%
Whites Canyon n/o Soledad Canyon	39	39		0%
Wiley Canyon e/o Orchard Village	11		11	0%
Orchard Village n/o Lyons	22		21	-2%
Newhall Ranch e/o McBean Parkway	33	32		-3%
Soledad Canyon e/o Rainbow Glen	48	46		-4%
